ROUTINIZING CHLAMYDIA AND GONORRHEA TESTING AND TREATMENT IN PRIMARY CARE

Gale R. Burstein, MD, MPH, FAAP, FSAHM
Commissioner, Erie County Department of Health, Clinical Professor of Pediatrics, Jacobs School of Medicine and Biomedical Sciences, Buffalo, NY
Faculty, NYC STD/HIV Prevention Training Center
Disclosures

Dr. Gale Burstein has no financial relationships to disclose or Conflicts of Interest to resolve.

Commercial support: There is no outside funding for this activity.

Unlabeled use: Dr. Gale Burstein’s presentations will include discussion of unlabeled use of gonorrhea and chlamydia nucleic acid amplification tests (NAAT) of non-genital specimens and trichomonas NAATs of male urine specimens that are not FDA-approved. Clinical laboratories may conduct validation studies to obtain CLIA approval to perform these tests.
Learning objectives

• By the end of this lecture, you will be able to….
  • Explain why sexual health services are important for pediatricians to provide
  • Describe how to routinize STI care in 1º care
  • List 3 non-invasive STI tests
WHY IT MATTERS

OFFICE SYSTEMS CHANGES?
Lessons learned....

- Collect urine specimen from all teens at all visits at registration
- Provide brochure at registration about what to expect at adolescent visit
- Reconfigure screening/vital sign room into teen "safe intake room"
- MA/nurse ask Sexual Health History (Sex Hx) routinely
- Use EMR Sex Hx template
- Provider checks EMR Sex Hx at all visits
- EMR “care card” includes sexual history and CT/GC screening on it for patients age 13-24
- Follow proper STI testing/specimen collection
- Develop test of re-infection and EPT f/u process for STI cases
- Post clinic signage

Why Screen for Chlamydia?
An Implementation Guide for Healthcare Providers

- Early identification and treatment:
  - Reduces pelvic inflammatory disease (PID)
  - Reduces infertility, ectopic pregnancy, and chronic pelvic pain
  - Prevents complications in newborns
Screening for Chlamydia

Routine chlamydia screening is recommended for all sexually active adolescents and young women age 25 years and under. Women over age 25 with risk factors such as new or multiple sex partners, all pregnant women, and men who have sex with men, or are in high risk settings should also be screened. Chlamydia is easily detected from a swab or urine specimen and treated with antibiotics. Rescreening and treating:

Teen Friendly Office Tips

These office practices and suggestions can be adapted to any outpatient medical setting. Choose the ones that work in your office.

- Report lab results
- Prescribe treatment
- Discuss partner notification

- Partner must seek health care
- No sexual contact until seven days after treatment begins

Normalize screening: “We routinely screen our patients to make sure we are not missing a problem.”

Offer materials in a private location where teens will feel comfortable taking them

Develop and post a policy of confidentiality

Make sure materials will fit into a pocket or purse

Office phones and triage are private

Offer office hours after school or walk in hours for teens

Establish practice-wide policy of time with adolescent without parent present

Encourage teens to share information with parent or trusted adult
Confidentiality thru full disclosure

• Inform parents/guardians about confidentiality policy before begin visit
  • Letter home or at registration
    • Detail what to expect at the visit
    • Discuss billing issues
  • Display materials such as posters or brochures discussing importance of confidentiality
• At age 11-12 yrs introduce concepts of confidentiality and alone-time for part of next visit
Drs. XXXX and XXXX provide routine health care for teens and young adults. We want to work with you and your family to meet all of your health needs: physical, mental and emotional.

Young adults need specialized medical care and a doctor with whom they can discuss anything, from acute and chronic illness, health maintenance and preventive care, sexual concerns and emotional problems. Their parents also need special guidance and support through these fears. Our practice goal is to provide comprehensive health care to teens and their families.

As teens begin to develop into adults and take more responsibility for their lives, we ask for more input from them about their health. As part of comprehensive health care, it is our practice to ask parents to wait outside for part of the interview and encourage the adolescent to discuss his or her own view of their problem. Talking to teens without the parent also gives teens a chance to ask questions or give information they may feel self-conscious about. Teens often have questions or concerns that they may feel embarrassed to talk about in front of their parents. It is important to give them enough freedom to grow but not so much that they get involved in the wrong activities.

Many teenagers and young adults experiment with high-risk behaviors that can lead to serious problems.

In New York State high schools (excluding NYC):

- 36% have tried cigarette
- 69% drank alcohol
- 37% have tried marijuana
- 44% have had sex

Most teenagers will hide their behavior so parents are not the first to find out. Our goal is to help identify these problems before they become too big and to help prevent them. To do this we must give them a reason to trust us.

New York State law requires that some services are offered to teens privately. We ask parents to leave for part of the interview for confidentiality and to build trust. We also encourage the teen to discuss important issues with parents.

It is important to know that if they are doing anything to hurt themselves or others, or if someone is hurting them, we will be forced to break confidentiality.

Drs. XXXX and XXXX are always available to discuss health problems or answer questions and to work with you to help your teen or young adult child make the best choices for a healthy future.
Confidentiality Statement

Drs. Raiken and Ehlenfield provide routine health care for teens and young adults. We want to work with you and your family to meet all of your health care needs: **physical, mental and emotional.**

Young adults need specialized medical care and a doctor with whom they can discuss anything, from acute and chronic illness, health maintenance and preventive care, sexual concerns and emotional problems. Their parents also need special guidance and support through these years. **Our practice goal is to provide comprehensive health care to teens and their families.**

As teens begin to develop into adults and take more responsibility for their lives, we ask for more input from them about their health. As part of **comprehensive health care,** it is our practice to ask parents to wait outside for part of the interview and encourage the adolescent to discuss his or her own view of their problem. Talking to teens without the parent also gives teens a chance to ask questions or give information they may feel self-conscious about. **Teens often have questions or concerns that they may feel embarrassed to talk about in front of their parents.** It is important to give them enough freedom to grow but not so much that they get involved in the wrong activities.

Many teenagers and young adults experiment with **high-risk** behaviors that can lead to serious problems.

In New York State high schools (excluding New York City):

- 46% have tried cigarettes
- 73% drank alcohol
- 38% have tried marijuana
- 43% have had sex

Most teenagers will hide their behavior so parents are not the first to find out. Our goal is to help identify these problems before they become too big and to help prevent them. To do this we must give them a reason to trust us.

**New York State law requires that some services are offered to teens privately.** We ask parents to leave for part of the interview for confidentiality and to build trust. We also encourage the teen to discuss important issues with parents.

More Information

- Websites for Adolescent Patients and their Parents/Guardians
- Confidentiality Statement
OUR POLICY ON CONFIDENTIALITY

Our discussions with you are private. We hope that you feel free to talk openly with us about yourself and your health. Information is not shared with other people unless we are concerned that someone is in danger.
Meaningful use challenges

• Patient instructions required for 50% visits
  o May contain confidential information
  o Can give to patients directly at ≥ 18 yrs
    • May need to give directly to adolescent
  o May need to work with EMR on ways to delete/hide confidential information from patient instructions
  o Adolescent patient portal may be accessed by parent
"I'm right there in the room, and no one even acknowledges me."
Confidentiality and Billing

- Cannot always guarantee confidentiality
- Most commercial plans send explanation of benefits (EOBs) to policyholder/insured
- Insurers not required to provide insured/subscriber with EOB if
  - service is provided by a facility/provider participating in insurer’s program
  - full reimbursement for claim, other than a co-payment, is paid by insurer directly to participating facility/provider
- Some health plans NOT sending EOBs if only copayment due
  - Health plan may send EOB unless dependent requests that EOB not sent
  - Need to check with specific carrier for details on suppressing EOB
CT/GC test as part of WCC

• CPT Modifier 33 aids in correctly coding for preventive services under ACA with no cost sharing

• Link GC/CT test to the “well child” code or “screening for” code
  • some payers use their benefits to adjudicate claims
    • screening services covered under preventive benefits
    • look to ICD code to tell health plans “why” service is provided
Explanation of Benefits (EOBs) Medicaid

• Medicaid does not routinely send EOBs
  • Denials are exception
• No control over lab bills/statements

CHLAMYDIA AND GONORRHEA TESTING
POLICY STATEMENT

Screening for Nonviral Sexually Transmitted Infections in Adolescents and Young Adults

abstract

Prevalence rates of many sexually transmitted infections (STIs) are highest among adolescents. If nonviral STIs are detected early, they can be treated, transmission to others can be eliminated, and sequelae can be averted. The US Preventive Services Task Force and the Centers for Disease Control and Prevention have published chlamydia, gonorrhea, and syphilis screening guidelines that recommend screening those at risk on the basis of epidemiologic and clinical outcomes data. This policy statement specifically focuses on these curable, nonviral STIs and reviews the evidence for nonviral STI screening in adolescents, communicates the value of screening, and outlines recommendations for routine nonviral STI screening of adolescents. *Pediatrics* 2014;134:e302–e311

EVIDENCE TO SUPPORT NONVIRAL STI SCREENING

The goal of sexually transmitted infection (STI) screening is to identify and treat individuals with treatable infections, reduce transmission

COMMITTEE ON ADOLESCENCE and SOCIETY FOR ADOLESCENT HEALTH AND MEDICINE

KEY WORDS
sexually transmitted infections, nonviral STIs, chlamydia, gonorrhea, syphilis, screening

Other STI screening guidelines

- CDC: www.cdc.gov/std/treatment
- USPSTF: www.uspreventiveservicestaskforce.org/uspsttopics.htm
- ACOG: www.acog.org/Resources-And-Publications
Chlamydia (CT) and Gonorrhea (GC): ♀

• Routinely screen all sexually active ♀ ≤25 years annually for CT and GC

Prevalence, %

CT and GC: ♂ who have sex with ♂

- Routinely screen sexually active adolescent and young adult MSM annually based on sexual behavior
  - Rectal and urethral CT and GC
  - Pharyngeal GC
  - Screen every 3 to 6 months if high risk
    - multiple or anonymous partners, sex with illicit drug use, or sex partners who participate in these activities
CT and GC: ♂ who have sex with ♀

• CT: Consider screening sexually active annually in settings with high prevalence rates with multiple partners
  • adolescent/primary care clinics, jails or juvenile corrections facilities, national job training programs, STD clinics, or high school clinics

• GC: Most male urethral GC infection symptomatic
  • Consider screening ♂ who have sex with ♀ annually on basis of individual and population risk factors
  • Substantial racial disparity exits for gonorrhea
Other STIs recommended screening

- **Syphilis**: MSM and pregnant ♀
- Trichomonas: consider screening ♀ if high risk for infection
- Routine screening of asymptomatic adolescents for other STIs not generally recommended
  - BV, HSV, HPV, HAV, HBV
Prevention Counseling

• Patient-centered, age-appropriate anticipatory guidance
• Integrate sex ed into clinical practice;
  • can use educational materials
• Prevention guidance
  • abstinence
  • safer sexual practices
  • condoms
Adolescent Healthcare Information Resources

Websites for Health Information

Advocates for Youth:
http://www.advocatesforyouth.org/

Advocates for Youth envisions a society that views sexuality as normal and healthy and treats young people as a valuable resource.

The American Social Health Association:

STI SCREENING
Recommendations for the Laboratory-Based Detection of Chlamydia trachomatis and Neisseria gonorrhoeae — 2014
Chlamydia/Gonorrhea NAAT Screening: Preferred Noninvasive Genitourinary Specimens

♀: Vaginal swab
   - Vaginal swab samples are as sensitive as endocervical swab specimens
   - Urine samples acceptable
     - Urine may have ↓ performance compared to genital swab samples

♂: Urine
   - Urethral swab samples may be ↓ sensitive than urine

www.cdc.gov/std/laboratory/2014LabRec/default.htm
Vaginal Swab

1. Wash your hands with soap.
2. Sit on the toilet or stand with one foot resting on the edge of the toilet. Separate the labia (lips).
3. Put the tip of the cotton swab stick about 2 cm inside the vagina. Twirl or rotate the swab once. Count to ten and remove the swab.
4. Follow instructions given by your doctor or nurse.
5. Wash your hands with soap.

Nongenital GC/CT NAAT vs Culture Performance

NAAT endocervical test kit: also used for pharynx and rectum

- **Pharynx**
  - Swab both tonsillar pillars and posterior pharynx (like strep) using a NAAT swab and collection tube

- **Rectum**
  - Insert NAAT swab 3-5 cm into rectum and rotate gently around the rectum as it is withdrawn
How to order non-genital GC/CT NAAT

• Use specimen collection kits and swabs for cervical or urethral specimens
• Non-genital GC/CT NAATs can be done by clinical laboratory with CLIA approval
• Lab diagnostics test codes available for pharyngeal, rectal, and urine/urethral from clinical labs that offer testing
  • National clinical labs have CLIA approval, offer tests, and test codes available
VAGINITIS DIAGNOSTIC TESTS

Point of Care (POC)

Clinical lab
CLIA – waived, POC BV test

- OSOM BVBLUE Test (Sekisui Diagnostics, Framingham, MA)
  - detects elevated vaginal fluid sialidase activity, an enzyme produced by bacterial pathogens associated with BV including *Gardnerella, Bacteroides, Prevotella* and *Mobilincus*

- Results available in 10 minutes
The generation of a blue or green color in the testing vessel or on the head of the swab

POSITIVE

The generation of a yellow color in the testing vessel

NEGATIVE
CLIA – waived, POC, trichomonas tests

• OSOM Trichomonas Rapid Test (Sekisui Diagnostics, Framingham, MA)
  • immunochromatographic capillary flow dipstick technology
  • test vaginal secretions
  • self-testing may be an option
  • sensitivity 82-95% / specificity 97–100%

• Results available in 10 minutes
Add sample buffer to test tube

Let stand 1 min.

Insert test stick into extracted sample

Remove swab from tube

Read results in 10 min.

POSITIVE

NEGATIVE

INVALID

OSOM® Trichomonas Rapid Test
Trichomonas NAATs

- APTIMA Trichomonas vaginalis assay (Hologic Gen-Probe, San Diego, CA)
  - FDA cleared for ♀ vaginal, endocervical, or urine specimens
  - Sensitivity = 95–100% / specificity = 95-100%
  - Can test ♂ urine or urethral swabs if validated per CLIA specification

- BD Probe Tec TV Qx Amplified DNA Assay (Becton Dickinson, Franklin Lakes, NJ)
  - FDA-cleared for ♀ endocervical, vaginal, or urine specimens
Other vaginitis lab tests

- **Affirm VP III** (Becton Dickinson, Sparks, MD)
  - nucleic acid probe-hybridization test
  - FDA-cleared to test vaginal secretions
  - evaluates for *T. vaginalis*, *G. vaginalis*, and *C. albicans*
  - results available within 45 minutes
  - sensitivity = 63% and specificity = 100%

- **Trichomonas Culture**
  - vaginal secretions preferred ♀ specimen
  - sensitivity = 75-96% / specificity up to 100%
  - can test ♂ urethral swab, urine, or semen

- **Wet prep exam of vaginal secretions**
  - sensitivity = 51-65%
  - requires immediate evaluation of the specimens for optimal results

Downloads and Resources

Download the 2015 STD Treatment (Tx) Guide app®, an easy-to-use reference that combines information from the STD Treatment Guidelines as well as MMWR updates, and features a streamlined interface so providers can access treatment and diagnostic information. The free app is available for Apple devices. An Android app is currently being developed and will be available this summer.

A limited amount of Wall Charts and Pocket Guides are available for you to order from CDC INFO on Demand. To print your own, download the high-resolution print files below and take them to a commercial printer.
